Course Objectives:-

- 1. To develop the comprehensive understanding of laws of physics related to Waves. Acoustics and Optics and ability to apply them for laying the foundation for research and development.
- 2. To work ethically as member as well as leader in a diverse team.

Course Outcomes:-

- 1. Student will be able to understand and solve the problems related to Waves, Acoustics and Optics
- 2. Student will be able to determine physical parameter experimentally with optimal usage of resources and complete the assignments in time.

Shri Vaishnav Vidyapeeth Vishwavidyalaya, Indore

BSPH 202: Waves, Acoustics and Optics

Unit-I:

Waves in Media: Speed of transverse waves on a uniform string, speed of longitudinal waves in a fluid, energy density and energy transmission in waves, typical measurements. Waves over liquid surface: gravity waves and ripples Group velocity and phase velocity, their measurements

Superposition of waves: Linear homogeneous equation and the superposition principle, non linear superposition and consequences.

Standing waves: Standing waves as normal modes of bounded systems, examples. Harmonics and the quality of sound; Chaldni's figures and vibrations of a drum. Production and detection of ultrasonic and instrasonic waves and applications.

Unit-II:

Noise and Music; The human ear and its responses; limits of human audibility, intensity and loudness, bel and decibel, the musical scale, temperament and musical instrument.

Reflection, refraction and diffraction of sound. Acoustic impedance of a medium, percentage reflection and refraction at a boundary, impedance matching for transducers, diffraction of sound, principle of a sonar system ranging.

Unit-III:

Applied acoustics: Transducers and their characteristics, recording and reproduction of sounds, various systems, Measurements of frequency, waveform, intensity and velocity. The acoustics of halls, reverberation period, Sabine's formula.

Fermat's Principle of extremum path, the aplantic points of a sphere and other applications. General theory of image formation: cardinal points of an optical system, general relationship, lens and lens combinations, Lagrange equation of magnification, telescopic combinations, telephoto lenses and eyepieces.

UNIT IV:

Introduction to Interference, Fresnel's Bi-prism, Interference in Thin films, Newton's rings experiment, Michelson's interferencer and its application, Introduction to Diffraction and its Types, Diffraction at single slit, double slit and diffraction grating

Unit V:

Rayleigh criterion, resolving power of grating, Concept of polarized light, Brewster's laws, Double refraction, Nicol prism, quarter and half wave plate, circularly & elliptically polarized light.

Auproprise (ho)

List of Experiments (Any Eight)

- To determine the refractive index of the material of the prism using Na light.
- To determine the dispersive power of the material of the prism.
- Measurement of radius of curvature "R" of convex lens by Newton's ring experiment,
- Measurement of Resolving Power of Telescope. 4
- Measurement of "\u00e4" of Na light source using Diffraction Grating. -
- 6. To determine the mass of cane sugar dissolved in water using half shade polarimeter.
- 7. Heating efficiency of electrical Kettle with varying voltages.
- 8. Measurement of Resolving Power of prism.
- 9. Measurement of Resolving Power of grating.

10. Measurement of Frequency of A.C. mains by electrically maintained vibrating rod. -
